

Figure S25. Differential expression across appendages, by sex and by mating

Significance: adjusted $p < 0.001$ and $|\log_2\text{FC}| \geq 1$. Mating additionally requires the same direction against both virgin groups.
 Axes clipped at $|\log_2\text{FC}| 12$ and $-\log_{10}(q) 300$; 38 of 148,968 points are drawn on the boundary.
